

StayOS — Marketing Launch Brief (V3 — Product UI)

2026-10-04 · Based on CURRENT shipped product only · Production: web-amber-pi-98.vercel.app

Positioning

StayOS is a hospitality marketplace for Egypt and Arab markets — guests book stays in Arabic or English with all-inclusive pricing; hosts list, manage, and earn through a full operations console.

What the shipped product actually does (VERIFIED)

Surface	Shipped capability
Guest journey	Search (governorate/city), listing detail with photos, all-inclusive quote, Paymob card checkout, trips, reviews, favorites, booking messaging
Host journey	Identity verification (manual document review), listing builder + readiness, moderation, calendar/availability, reservations inbox with governorate→area→listing + status filters, earnings, payout preference (bank/wallet)
Account	Hierarchical account menu (avatar+name), profile, trips, favorites, messages+notifications with unread badges, settings incl. language (English / العربية)
Support	In-app support chat with booking context + staff triage queue; Help Center (role-aware guest/host articles) + FAQ
Platform	EN/AR fully localized with real RTL; instant + request booking; cancellation policies with automated refunds; push/email notifications
Trust	Server-side permissions, staff console, audit trail, private document storage

Payments messaging (reconciled)

Lead with **secure card checkout via Paymob** — the verified payment surface. A bank-transfer proof-upload flow is implemented in code but **pending operational configuration** (bank details not yet set) — do not market it as available.

Claims discipline — DO / DON'T

DO say	DON'T say
"All-inclusive pricing"	Any mention of commission %, fee splits, or host economics
"In-app support and Help Center"	"24/7 human support" (no SLA exists)
"Secure card checkout"	"Bank transfer available" (pending config) / "escrow" as a legal term / "automated host payouts" (payouts are manual)
"Identity verification for hosts"	"Automated/instant KYC" (manual review is the live path)
"Mobile app in rollout"	App-store availability claims (preview builds only)
"Arabic-first, full RTL"	Feature comparisons promising unshipped Airbnb capabilities

Journey assets for creatives

Screens that exist and can be screenshotted: search + filters, listing detail (photo gallery, all-inclusive price, cancellation policy), checkout (Paymob iframe), trips, booking detail (timeline + support link), messages, notifications, host dashboard (attention block), host reservations (cascade filters), host earnings, Help Center, support chat, admin console (internal only — never publish).

Guardrails

- Never show internal admin data, user IDs, or payment credentials.
- Never show internal fee economics in any guest-facing asset.
- Do not call funds 'legal escrow' — say 'secure payment handling'.
- Do not claim automated KYC, automated payouts, store availability, or an active bank-transfer rail.
- Use only the canonical production URL for product captures.

V3 changes: reflects shipped support system, Help Center, hierarchical account menu, host filter cascade, and verified payment surfaces; bank-transfer framed as pending operational configuration; removed anything not in production.
